I believe that the article “Improvement of density models of geological structures by fusion of gravity data and cosmic muon radiographies” by Jourde et al. quite sufficient time was discussed and three times revised. I have been traced this article during the long time. Without hesitation, it is interesting and useful article and I do not understand the passive position of many possible reviewers.

I would like to ask the authors to add this small paragraph with the aim to underline the exploration perspectives of this method.

I propose that the article may be "accepted as is".
